Media Query Practice Question

1. **Build a responsive Puppy Lover's Page using media queries:**
   - **Steps:**
     - Start by building **ONLY** the HTML structure of the Puppy Lover's page. This process is clearly explained under Basics of CSS class videos, 4.5 - Thinking in terms of containers
       - https://www.youtube.com/watch?v=J90pTe0bBMw
     - Follow the mobile first approach by developing for mobile screens before developing for desktop or any other device size.

       Note:
       Start by writing your general CSS that works for every size. Implement the mobile design on every size first. Then add a media query breakpoint at 768px and include the CSS styles that you want to apply only when the screen size is greater than 768px.
       - To understand on how to follow mobile first approach for this project, please refer the explanation provided during your class here:
         - https://www.youtube.com/watch?v=EcBbu2uiOD E
   - **Hint on how to organize your folders and files**
     - Create a folder called "**Week-5**" in your "**Phase-1**" folder.
     - Inside **"Week-5"** folder, Create a folder called "**PuppyProjectMediaQueries**".
     - Inside your "**PuppyProjectMediaQueries**" folder, create two folders called "**Resources**" and "**Project**".
     - Download the following zipped file, and extract it in the "Resources" folder. The zipped file contains designs for the puppy lovers page and images.
       - Puppy lovers page design

- Inside the "**Project**" folder, create an html file called "**myindex.html**". This is where you write your html code.
- Create a folder called "**CSS**", inside the "**Project**" folder. Inside the "**CSS**" folder, create a file called "**mystyle.css**"
- Inside the "**Project**" folder, create a folder called "**images**".
- Copy all the images from the "**Resource > images**" folder and paste these images in the "**Project > images**" folder.
- Now start building a responsive Puppy Lover's page.

Happy coding!
